

Trainer onboarding sequence

- 1. All users must go through the Profile Setup Screen that currently exists in the app. If they select they are a trainer then they proceed to the monetization screen. A trainer_id and user_id is created for them and sent to the AWS dynamoDB table
- 2. If the user selects that they are a trainer they are sent to the monetization screen shown (already exists). Once they select enable payouts that info (true or false) is sent to trainer table in dynamoDB (already exists)
- 3. ***Scope Required*** When the user enables payment they should be directed to a Strip-hosted UI that allows them to create a Stripe account. In Lambda I have already created a function for this to be possible but will need you to link to Stripe UI page. It is accounts.create and accountlinks.create.

Marketplace & Pricing

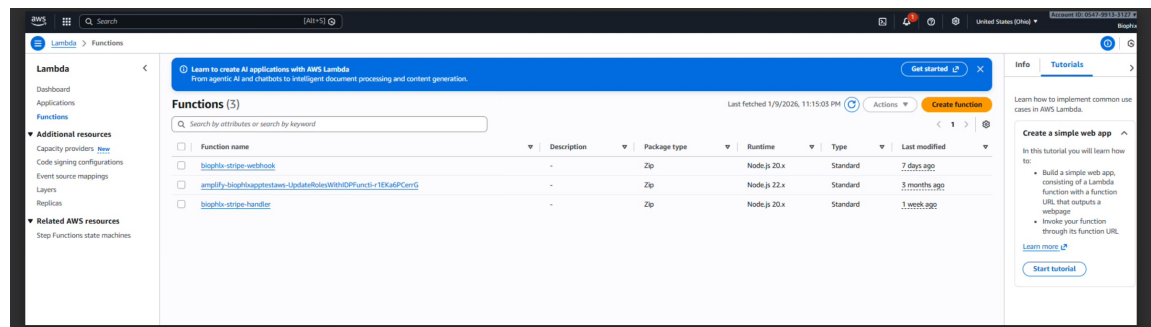

- 1. From the Homescreen (currently exists in code) users can select the trainers button and see a list of trainers currently on the platform.
- 2. The Trainers list pulls all trainers with a trainer_id in the dynamoDB table and shows their profile info (screen named TrainerDirectory in the code). The user can select the trainer they want.
- 3. The Trainer profile currently shows the trainer information and the workout products and workout services (created by the trainer from the trainer dashboard that only users with a trainer_id can access). The trainer sets the price and includes the workout and products.
- 4. ***Scope Required*** Need to link the price to Stripe PaymentIntent so that when the user selects purchase workout they are directed to a Stripe UI that handles checkout and wires payment correctly.

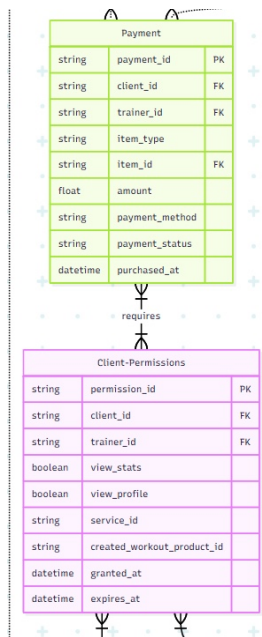

Checkout & Fee Collection

- 1. Based on the Stripe documentation this should be one parameter and includes Platform and Biophlx fee.

Strip Webhook Engine

1. This should be a Lambda webhook function. As you can see above I have already created a webhook function but I have not attached it to the App to update Stripe account, show if payment was successful of failed.
2. After purchase the user should have access to the purchased workout_product or workout_service. The workout_product or workout_service should be in a permissions table in dynamoDB. You will need to create these tables in the existing dynamoDB project on AWS and link the Stripe confirmation info.

TestFlight & Deployment

1. I already have a Apple Dev account and I have a current version that is live. This should simply but pushing an updated version to the existing TestFlight project

Based on the Scope here is what I think is a fair budget:

1. Trainer onboarding - \$500
2. Marketplace & Pricing - \$600
3. Checkout & Fees - \$800
4. Stripe Webhooks - \$600
5. TestFlight - \$200

Total: \$2,700
